Student Name: Alien Nader Abdel-Latif

Student Number: 240418104

Course: SEN210 – User Interface Programming

Project Title: Plot-Twist

Introduction

1. About My Project In this project, I made a mobile application called PLOT-TWIST. It is an app for finding and saving books. I used Flutter and Dart to build this application. My goal was to make a nice and creative app where users can easily discover new books..

2. UI/UX Design Principles Applied

- For the design, I used a girly theme. I used pink and baby blue colors because they look very good together and make the app look friendly. I used a **GridView** to show the books on the home page. I changed the code to show 3 books in one row to make the images smaller and fit the screen better. I also used rounded corners for the images so they don't look sharp..

Features I Used

- **Search and Categories:** I used a search bar (`TextField`) so the user can type and search for a book or an author. I also used category chips (like Fiction, Sci-Fi, Mystery) to filter the book list.
- **Animations:** I used the `Hero` widget for animations. When you click on a book cover, the picture smoothly flies to the next page.
- **My Library:** I used a simple `List` in Dart to save the user's favorite books. When I click the heart button on the details page, it adds the book to my saved list. I used `setState` to update the screen so the button changes and the user can see the book in their library immediately.

4. What I Learned This project helped me understand how to build a user interface in Flutter. I used many different widgets like `Container`, `Card`, and `ListView`. Right now, the app forgets the saved books when I close it because I only used a local list. In the future, I want to learn how to use a real database to save the data permanently.
